

# Certificate Services

## Mobile devices

### MOBILE DEVICES AT THE WORKPLACE

The use of mobile devices in everyday work increases and the possibilities are endless. CGI offers a solution that secures the communication between the mobile devices with the use of certificates. A certificate in the mobile device gives the user the opportunity to for example connect to the company's WIFI network. It also supplies a more secure way to synchronize e-mail and calendar through ActiveSync as well as the possibility to authenticate against in-house systems as timesheets, internal web and similar.

The service supports following operating systems:  
IOS 4.1+ (iPhone, iPad), Android 2.3+ (Samsung, Ericsson, HTC)  
WinPhone 7.5 (Nokia, Samsung)

### IN A SECURE WAY

The service provides an easy way to issue and enroll certificates to the company's mobile devices. CGI supplies a self administration interface where the end users can handle their devices themselves. The logon process is done with Single Sign-On (SSO) using existing Kerberos login.

The only things you need is a minor local service installed in the company's network and a connection to a directory or database that contains information about which users who is entitled to certificate and which devices they have. As for the rest everything is handled centrally by Certificate Services.

### MORE INFORMATION

Mobile devices is an add-on service that is managed and delivered by Certificate Service. The basic service Certificate Services offers issuing and verification of certificates. This can be combined with add-ons like for example automatic enrollment and Smart cards.
